

Occupancy and Control of  
Perennial Pepperweed (*Lepidium latifolium*)  
in Salt Marsh of  
San Pablo Bay National Wildlife Refuge

**Giselle Block**

USFWS, Inventory and Monitoring Program

**Dr. Vanessa Tobias, Dr. Emilio Laca**

Department of Plant Sciences, U. C. Davis

## Funding

National Fish and Wildlife Foundation  
CA Department of Fish and Wildlife  
USFWS National Invasives Program  
USFWS Coastal Program  
USFWS National Wildlife Refuge System  
Marin-Sonoma Mosquito and Vector Control District

## Partners

San Pablo Bay National Wildlife Refuge  
U.C. Davis, Department of Plant Sciences  
PRBO: Students and Teachers Restoring a Watershed Program  
Sonoma Land Trust  
Friends of San Pablo Bay NWR  
Renee Spenst (Ducks Unlimited)  
Ingrid Hogle (Invasive Spartina Project)  
Shelterbelt Builders

# San Pablo Bay National Wildlife Refuge

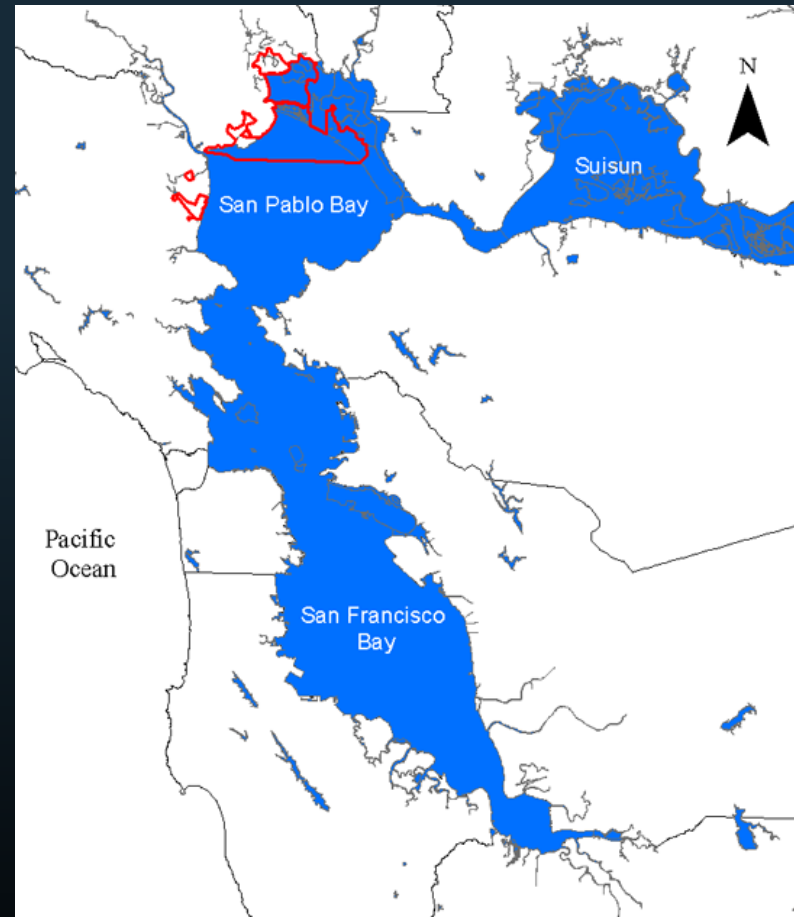

17,500 acres

Estuarine system

salt marsh

mudflats

subtidal

# *Lepidium latifolium* Control Program (2004-present)

## Fundamental Goal

Improve structure and function of tidal marsh by reducing stressors such as invasive plants

## *Lepidium latifolium* Management Objectives

Reduce cover of *Lepidium latifolium*

## Strategies

Inventory

Develop and Implement Control Plan

Restore native tidal marsh vegetation

Adapt and Learn

# Inventory (2,094 acres)

Tidal Marsh

2005-06 and repeated in 2010

Field Based (GPS-Trimble GeoXT)

Patch = Polygon

Inter-patch distance: 10-m

Data:

date, observer, location

cover class (<1%, 1-10%, 11-25%, 26-50%, 51-100%)

phenology, landcover features

San Pablo Bay

# Treatment

Annual: 2007-present

Herbicide: Habitat (imazapyr)

Late bud to flower stage

Backpack sprayers

Helicopter application

Cost: approximately \$250/acre

# Learn and Adapt

What land cover features are associated with *Lepidium latifolium* occurrence?

How effective was *Lepidium latifolium* control when treated with imazapyr?

What land cover features are associated with good and poor *Lepidium latifolium* control when treated with imazapyr

**Occupancy pre- and post-treatment:** Generalized additive model (R package mgvc) to describe land cover characteristics associated with *L. Lepidium* establishment and effectiveness of control

Variables (raster, 2x2-m pixels)

- *Lepidium latifolium* (response variable)
  - Presence (0/1), Decrease or increase (0 = no decline or increase, 1 = decline)
- Elevation
- Indices: water influence, vegetation

# Pre-treatment Inventory Results

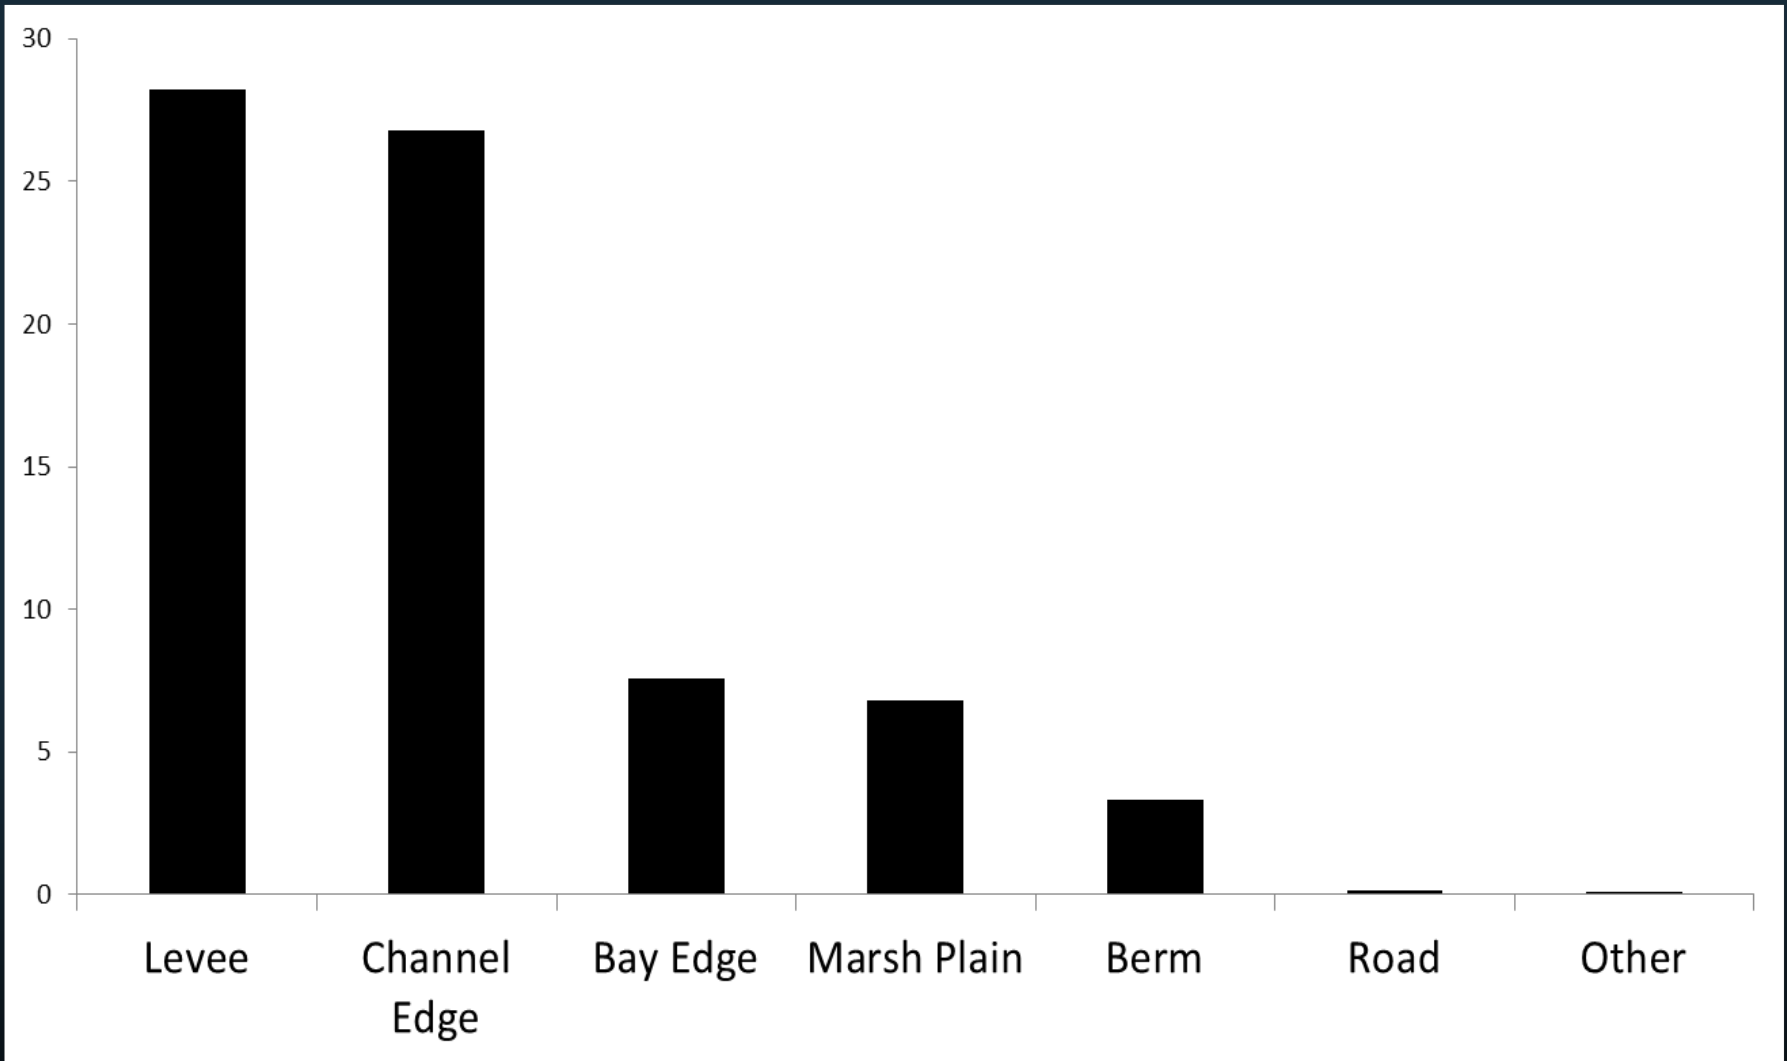

73 gross acres

3% of 2,049 acres infested

## Observed Patterns:

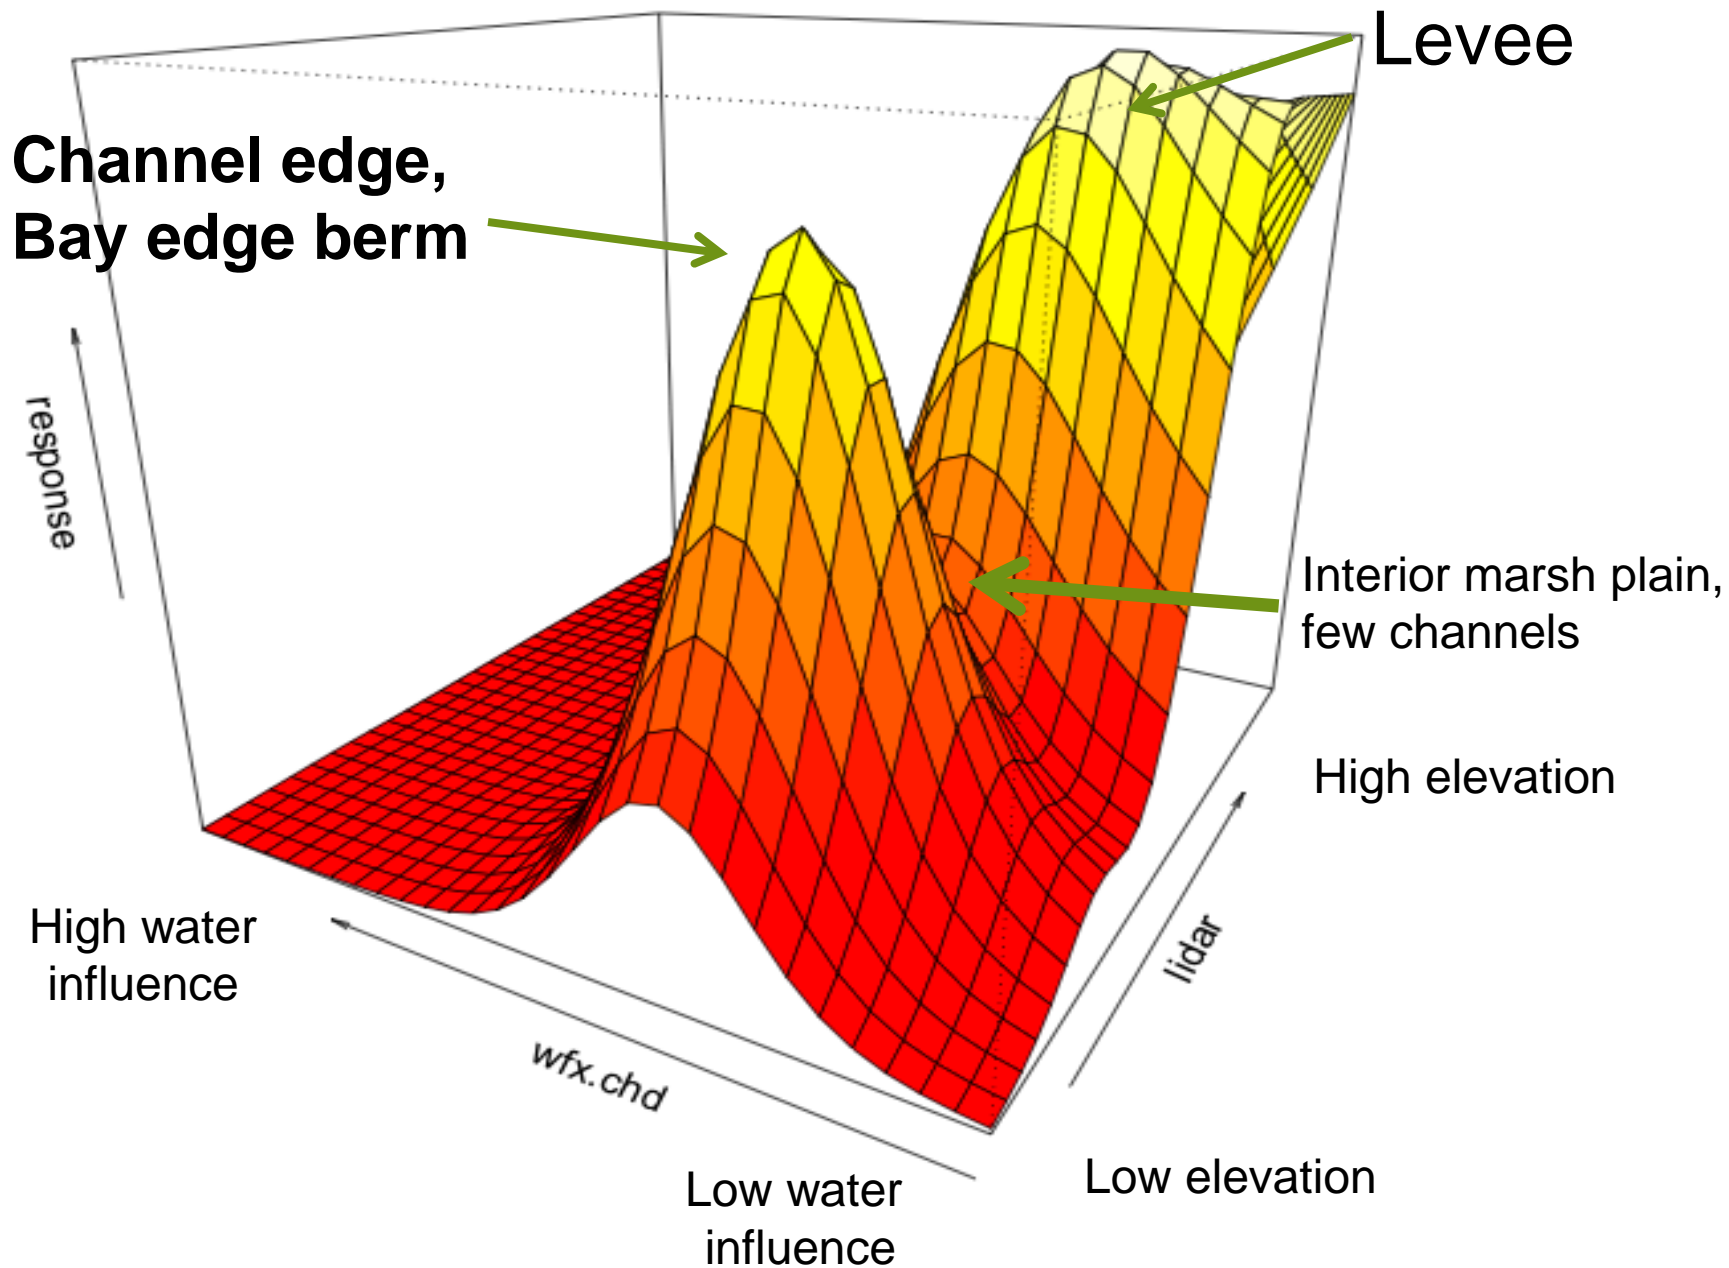

- Areas of tidal disturbance (levees, bay edge, channels)
- Restoration sites
- Fewer patches in interior marsh plain

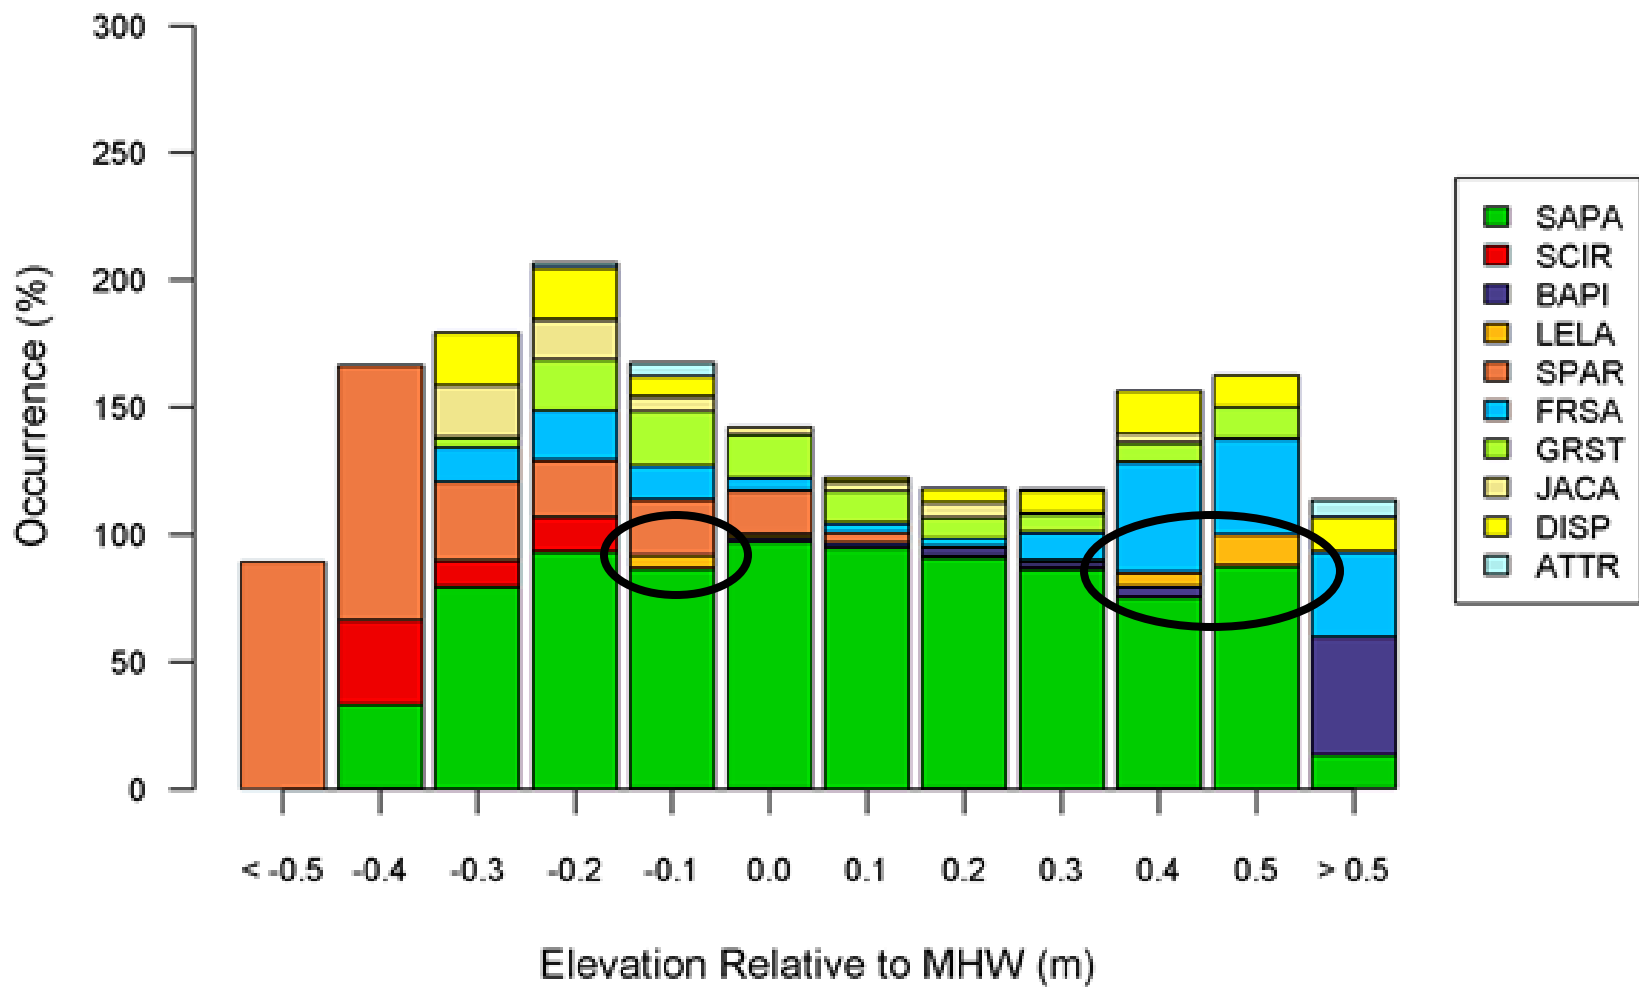

# Acres of *Lepidium latifolium* by Landscape Feature

San Pablo Bay

Intermediate elevation, low  
pickleweed/cordgrass influence

Intermediate elevation, high  
pickleweed/cordgrass influence

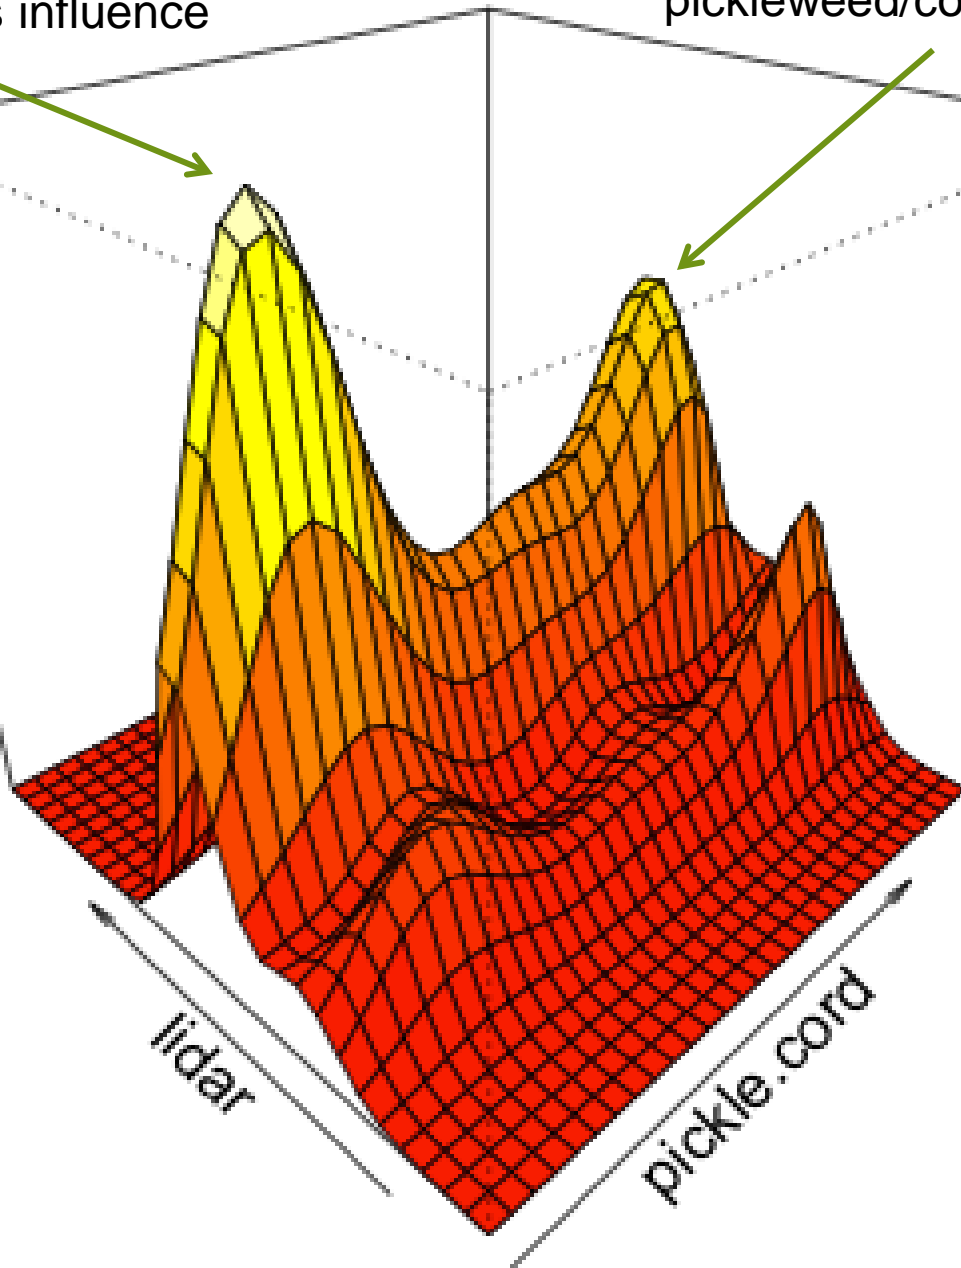

Perimeter levees

Channel edges,  
bay edge berm

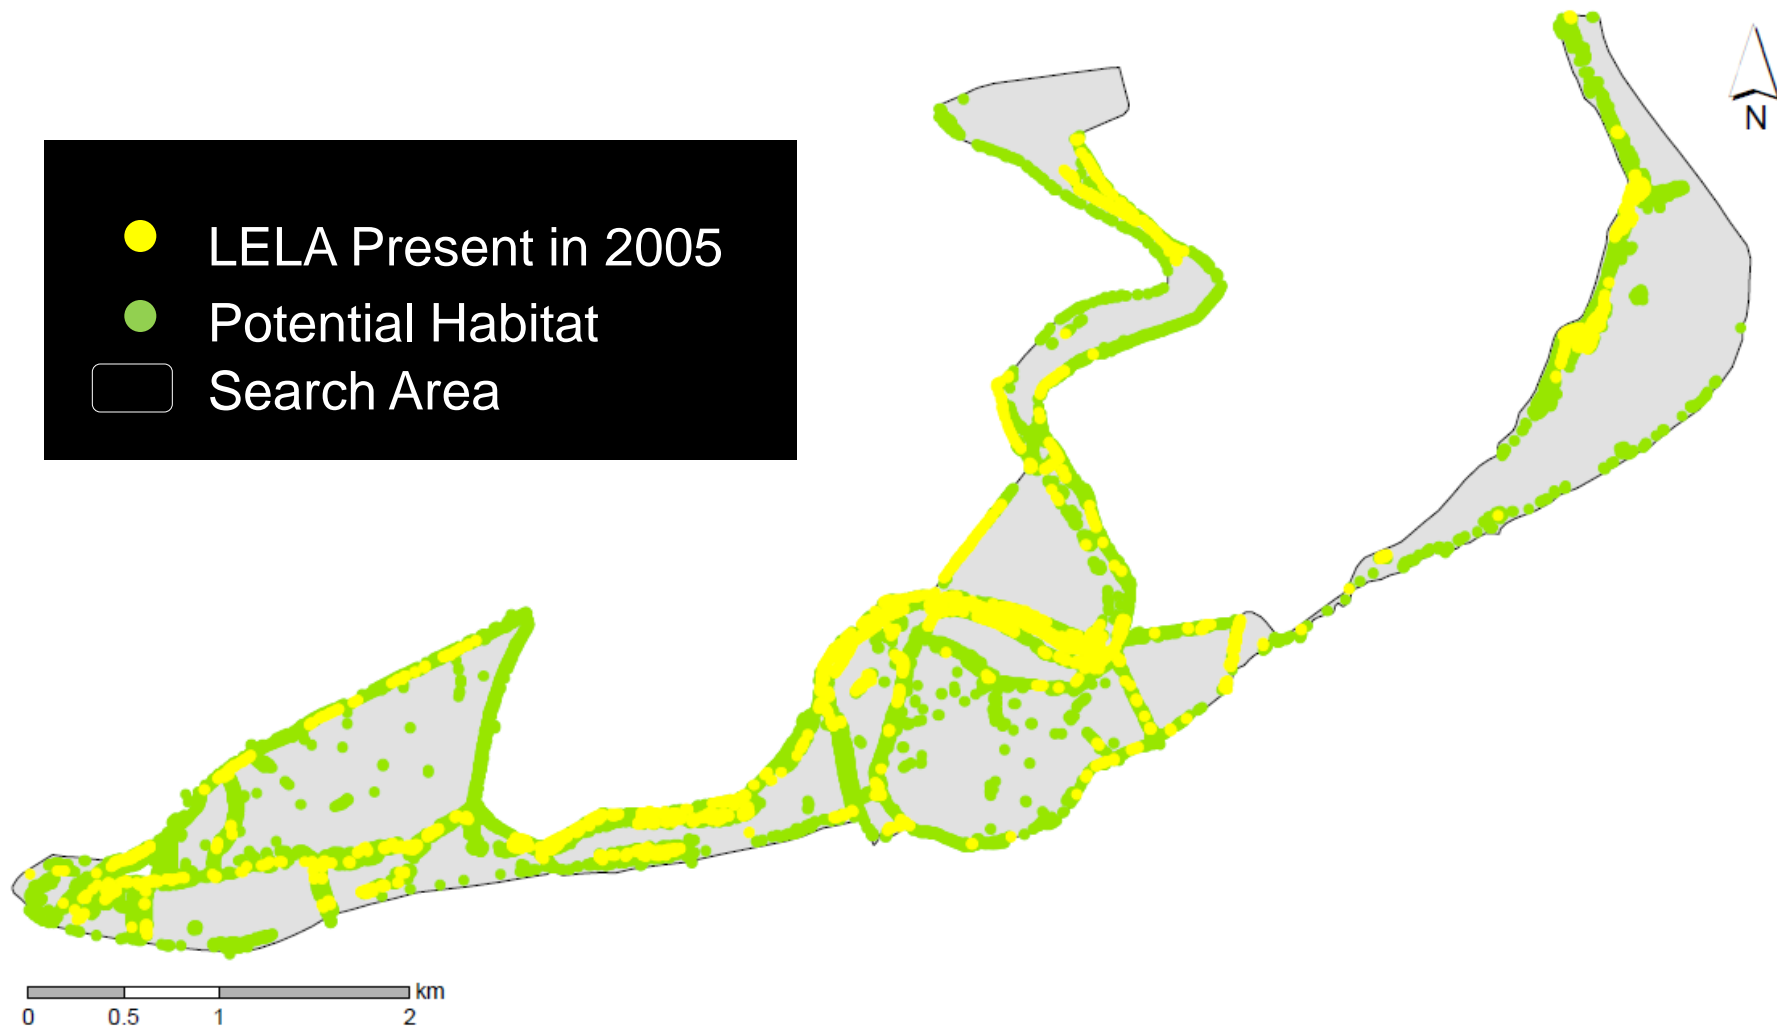

response

lidar

pickle.cord

# LELA Habitat

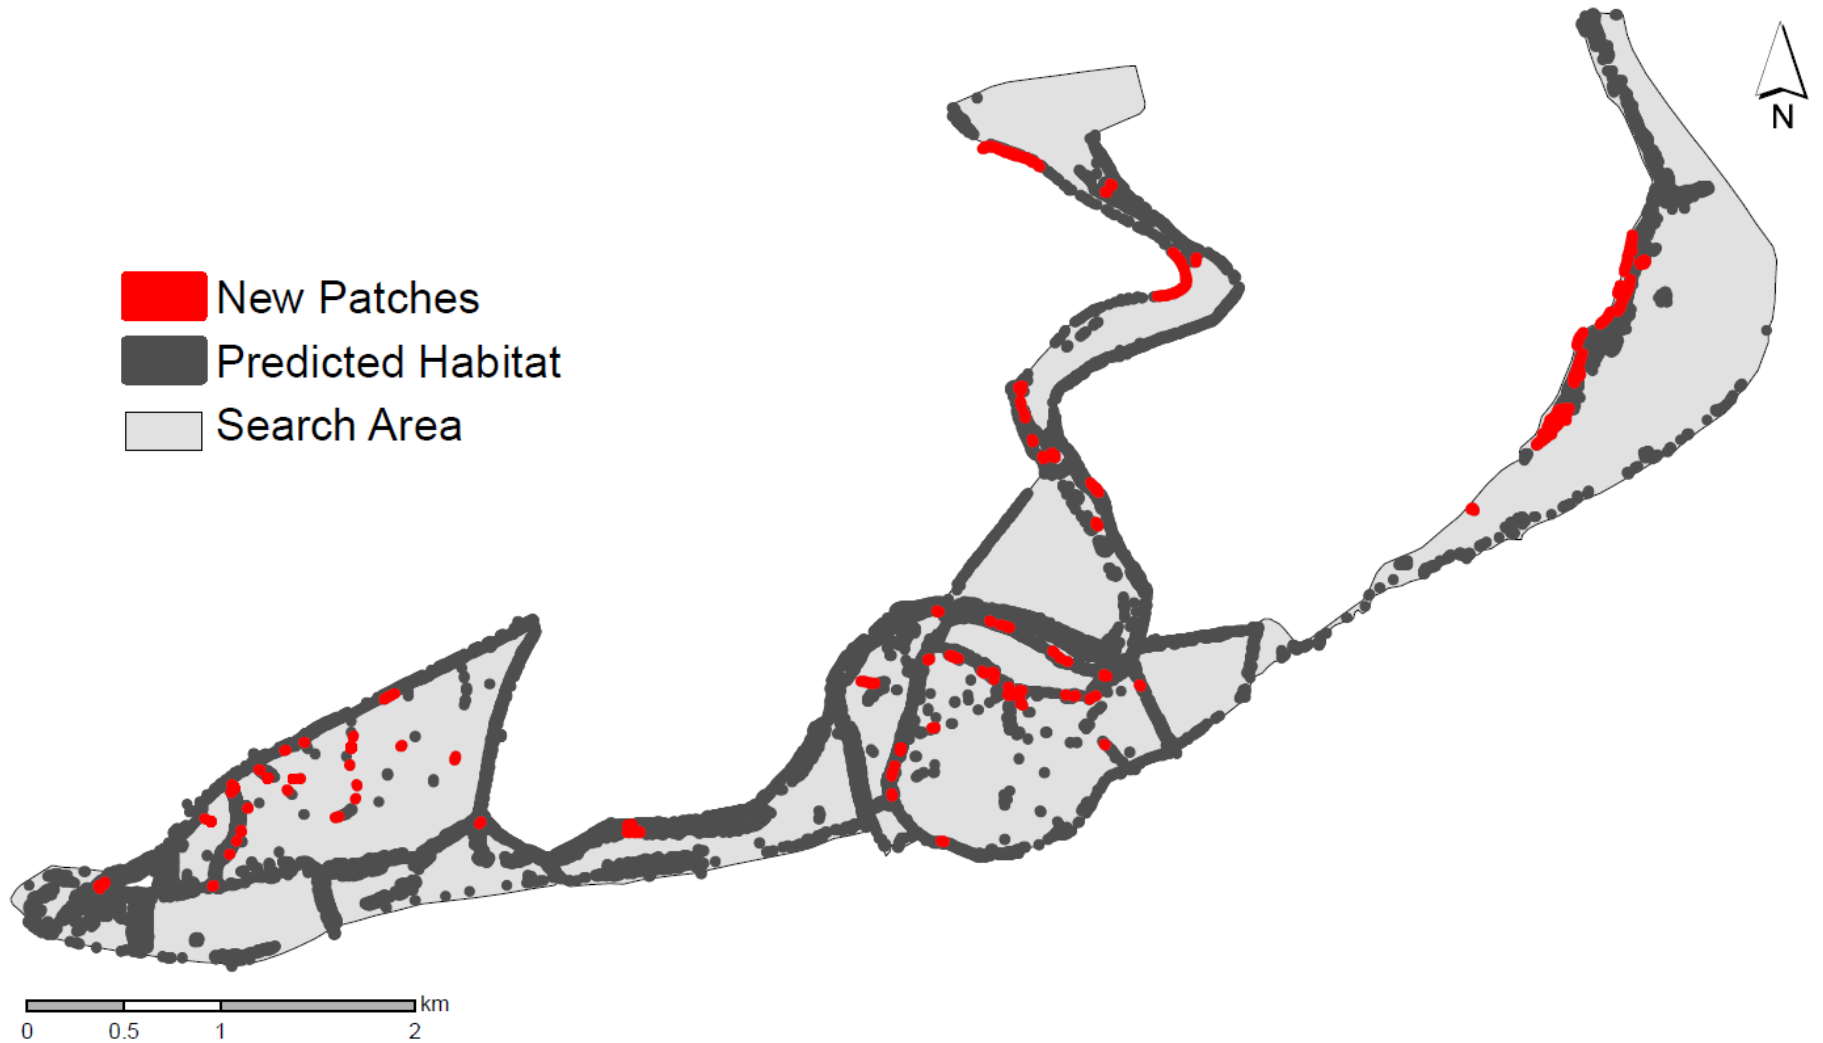

# Treatment Results

- Analysis area = 837 acres
- Gross acres
  - 2005 = 30.74 (mean patch size = 0.11)
  - 2010 = 4.38 (mean patch size = 0.03)

85.8% decrease in gross acres  
following 3 treatments (2007-2009)

# Model Predictions vs. Actual

Note: Patch sizes are highly exaggerated to show colors.

# Summary

Probability of *L. latifolium* occurring is greater at

- Intermediate marsh elevations
- Areas where resistant vegetation is absent
- Areas of intermediate water influence

Focus future search efforts at base of perimeter levees, bay edge berms, and channel edges

- Imazapyr (Habitat) is an effective tool to control *L. Latifolium* in tidal marsh of San Pablo Bay
- Inventory and monitoring are essential components of weed management programs
  - Increase knowledge of invasion patterns and environmental relationships
  - Efficient use of limited resources - prioritize populations for treatment
  - Estimate treatment costs
  - Increase success – learn and adapt
  - Increase funding
  - Contribute to larger landscape scale strategies

# Next Steps

Use results to adapt control plan

- Refine objectives and strategies
- Early detection: focused surveys
- Continued post-treatment monitoring

Expand treatment areas

Continue restoration of the marsh-upland transition zone
