

# Regional testing of *Diorhabda elongata* ecotypes for the biocontrol of Saltcedar (*Tamarix* spp.) in western US

Peter Dalin, T. Dudley, D. Thompson, D. Bean, B. Cashore, D. Eberts  
M. Forister, K. Gardner, E. Jones, D. Kazmer, J. Milan & C.J. DeLoach

# *Tamarix* invasions

- 
- The background image shows a dry, sandy riverbed or riparian area. In the foreground, several tall, thin Tamarix plants stand prominently. These plants have reddish-brown stems and green, narrow leaves. In the background, there are larger, more dense clusters of Tamarix bushes, indicating a significant invasion. The sky is blue with some scattered clouds.
- Invades riparian areas
  - Lowers ground water tables
  - Increases soil salinity
  - Reduces faunal and floral diversity
  - Increased fire hazard
  - Interferes with recreational uses

# Tamarix distributions in CA

*Tamarix parviflora*

*Tamarix ramosissima*

# Biocontrol agent *Diorhabda 'elongata'*

*D. elongata* – Fukang ecotype

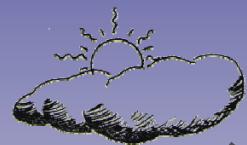

# Background

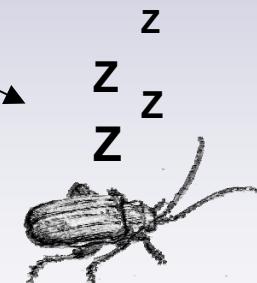

- *D. elongata* from Fukang (China) did not establish at sites below 38° N in latitude  
Lewis et al. (2003) Biol. Control, 27: 101-116
- Fukang beetles cease reproduction and enter reproductive diapause at day lengths of 14h 30min or less  
Bean et al. (2007) Env. Entomol. 36: 15-25

Fukang, China 44.1° N

# Evolution of daylength responses

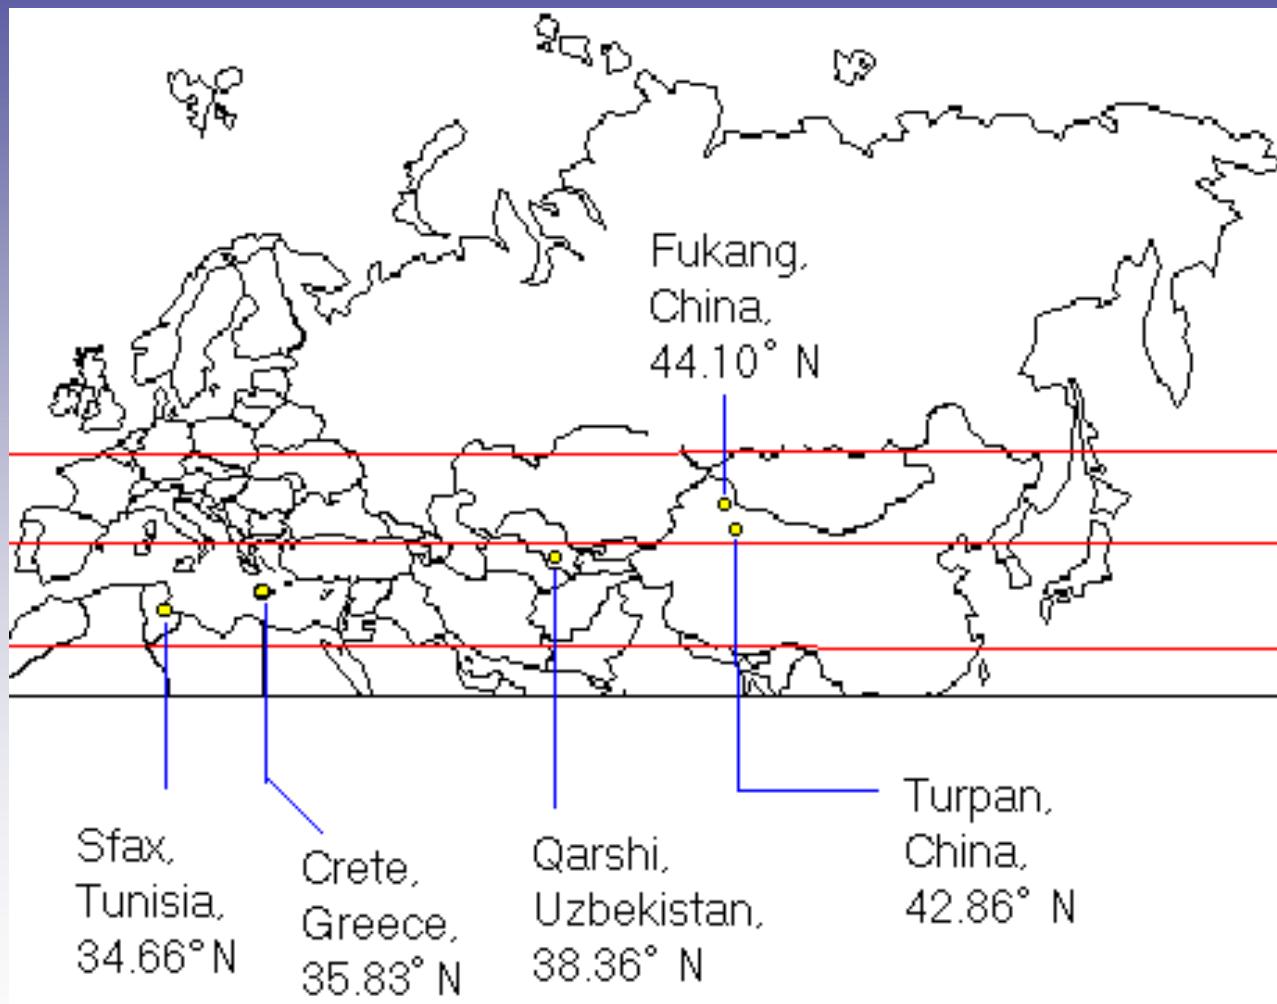

Reproduction

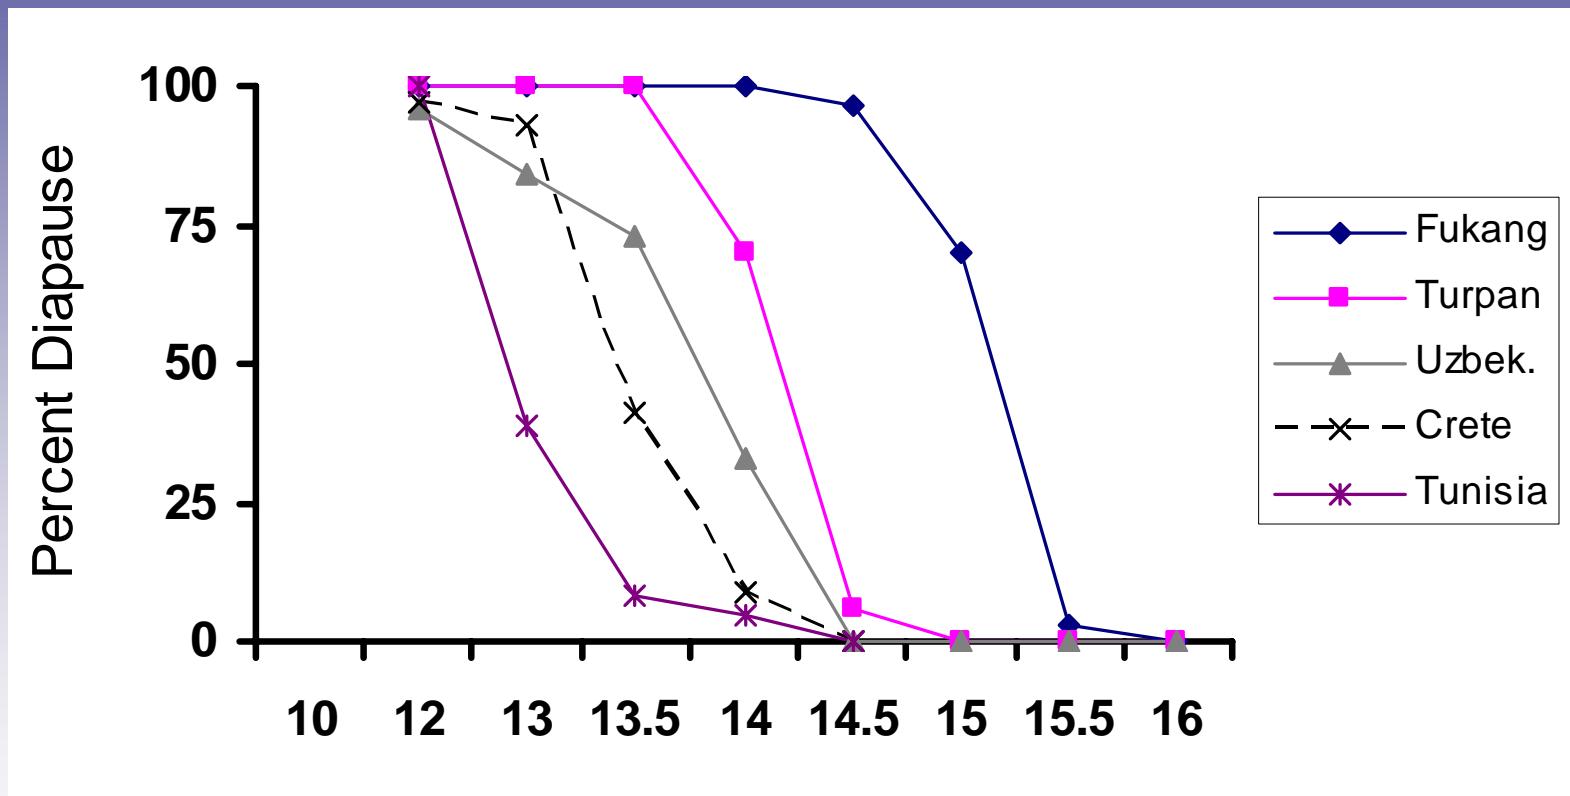

Diapause

# *D. elongata* ecotypes present in U.S.

# Daylength responses of *D. elongata* ecotypes

# Hypothesis

- *D. elongata* ecotypes will be reproductively active for the longest time periods at those latitudes that match their latitude of origin

Fukang, China	<i>D. elongata</i> ‘carinulata’	44.1° N
Turpan, China	<i>D. elongata</i> ‘carinulata’	43.5° N
Karshi, Uzbek.	<i>D. elongata</i> ‘carinata’	38.1° N
Crete, Greece	<i>D. elongata</i> ‘elongata’	35.1° N

# Methods

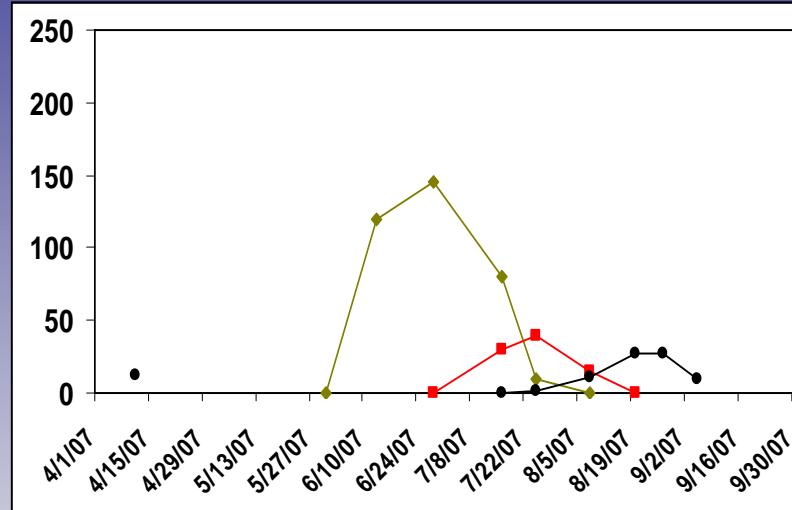

# Santa Clara River 34.3° N

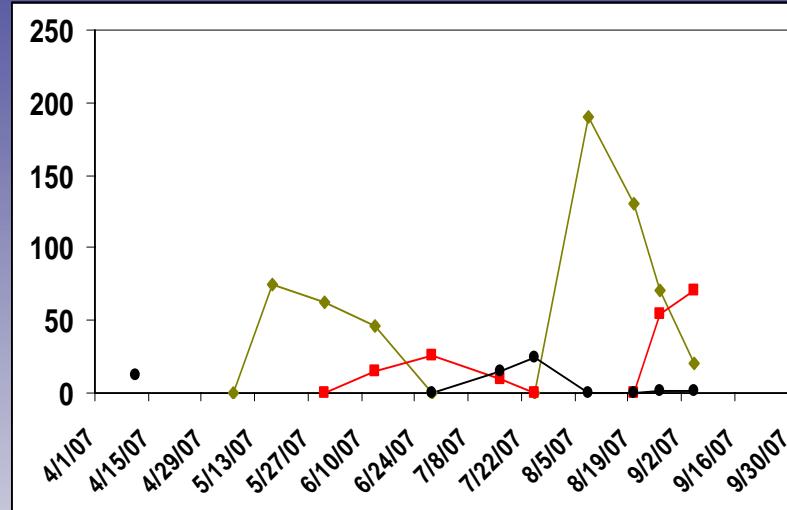

Host plant: *Tamarix ramosissima*

Fukang, China (44.1° N)

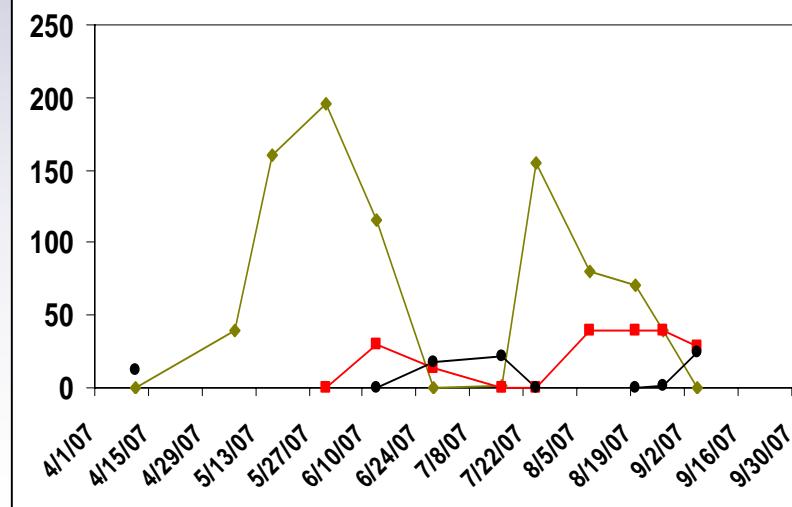

Turpan, China (43.5° N)

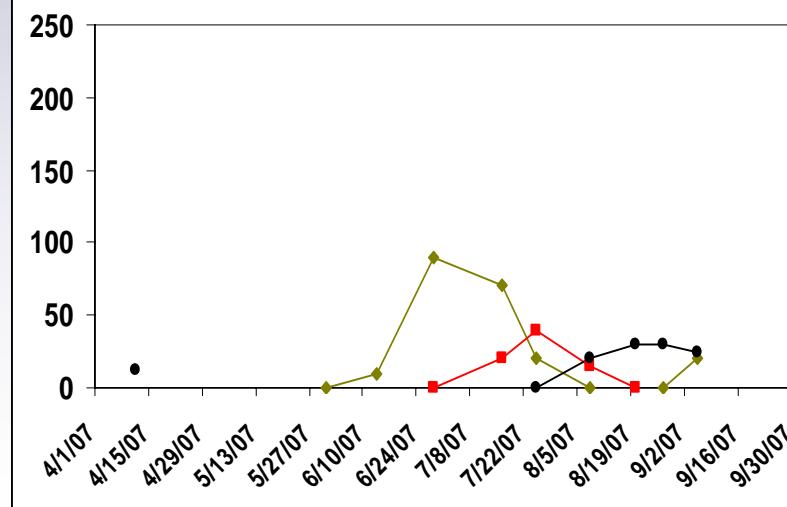

- ◇— larvae
- pupae
- adults

Karshi, Uzbekistan (38.1° N)

Crete, Greece (35.1° N)

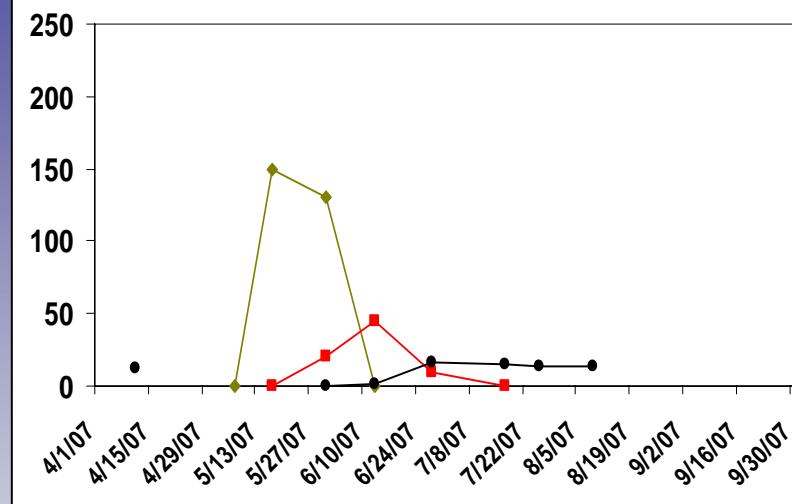

# Mojave River 34.9° N

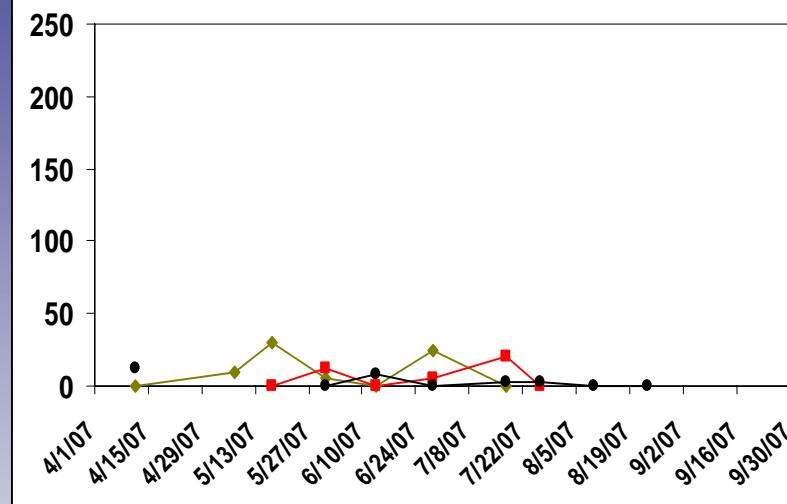

Host plant: *Tamarix ramosissima*

Fukang, China (44.1° N)

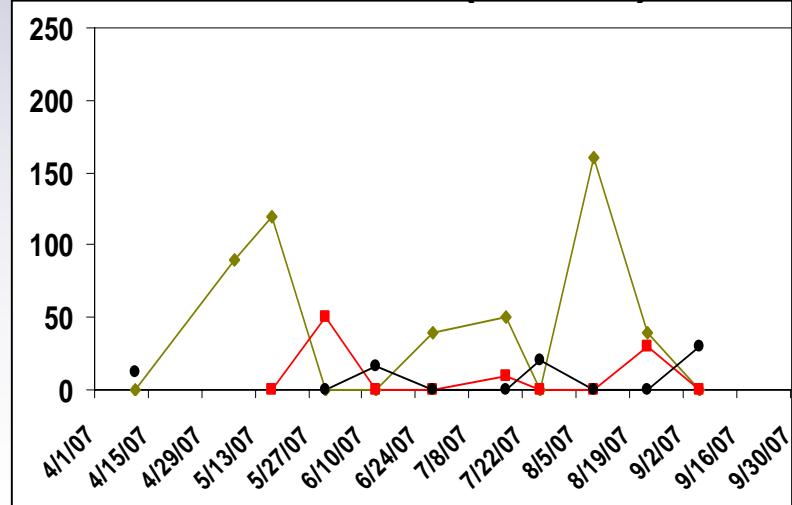

Turpan, China (43.5° N)

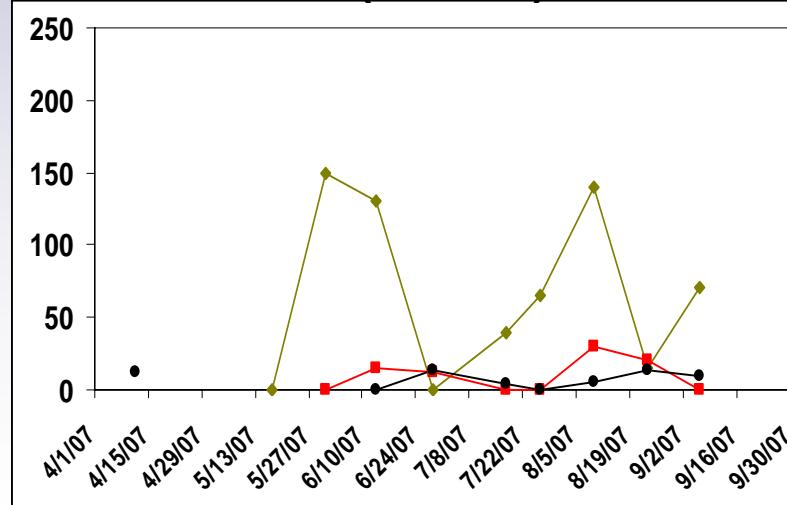

- ◇— larvae
- pupae
- adults

Karshi, Uzbekistan (38.1° N)

Crete, Greece (35.1° N)

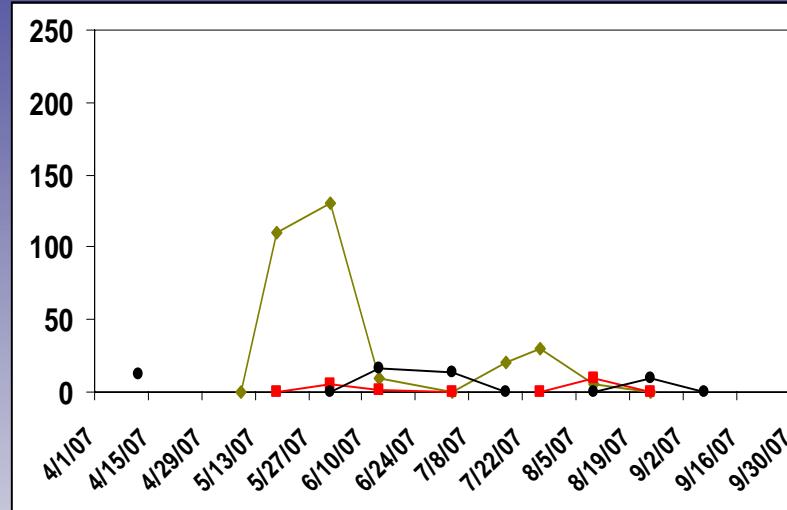

# Kern NWR 35.5° N

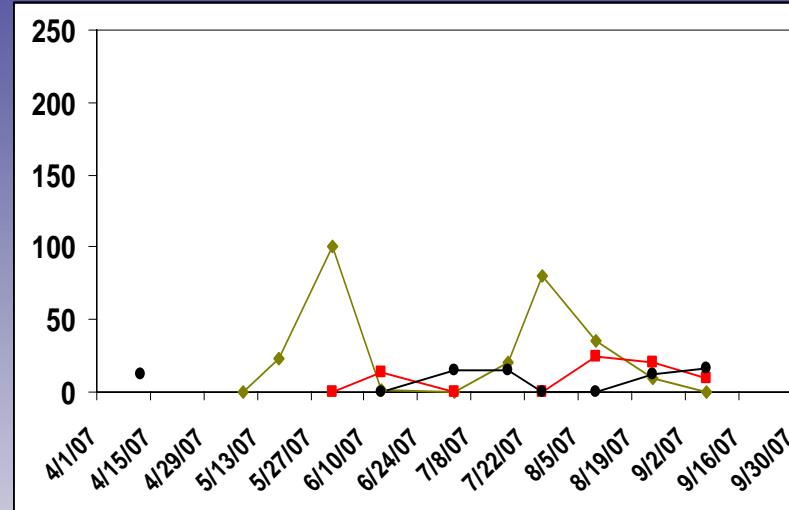

Host plant: *Tamarix ramosissima*

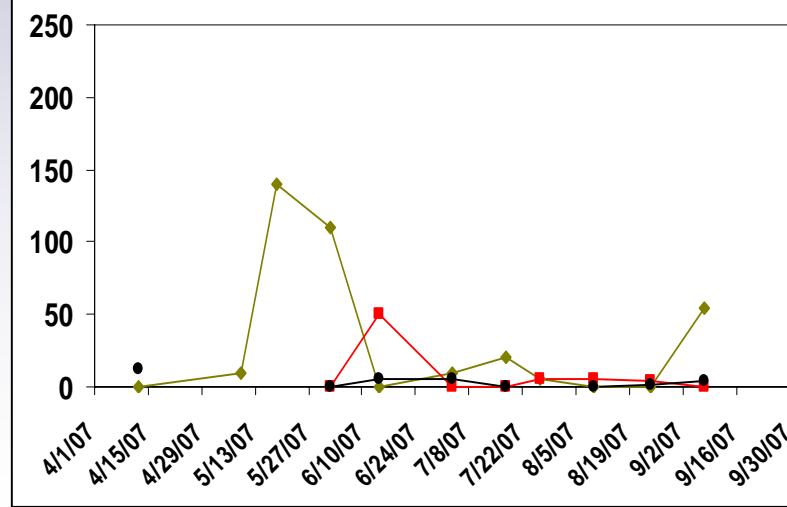

Fukang, China (44.1° N)

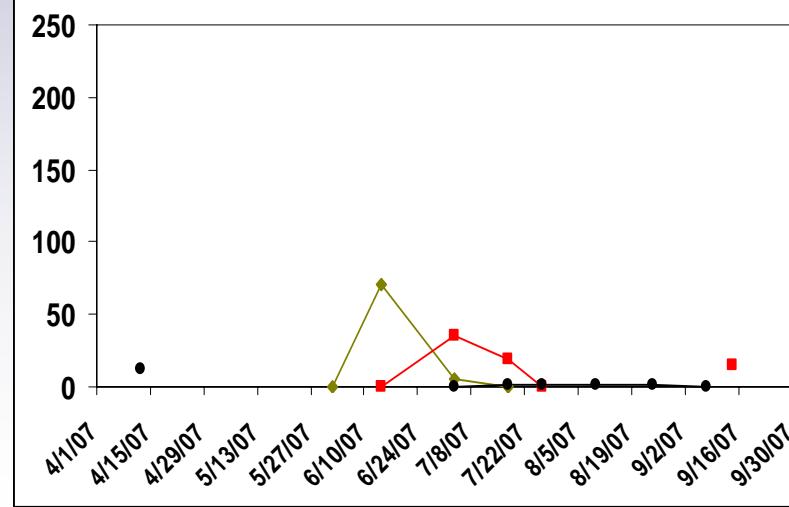

Turpan, China (43.5° N)

Karshi, Uzbekistan (38.1° N)

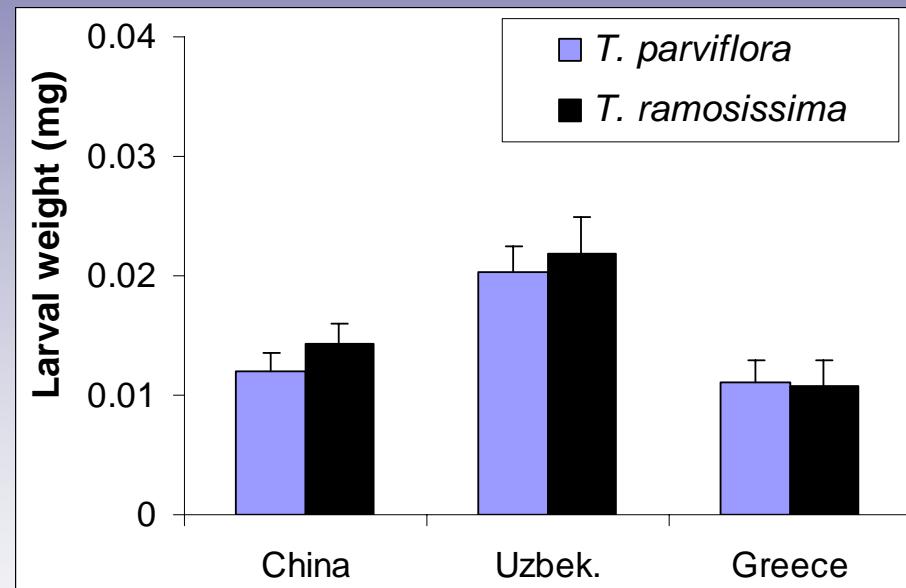

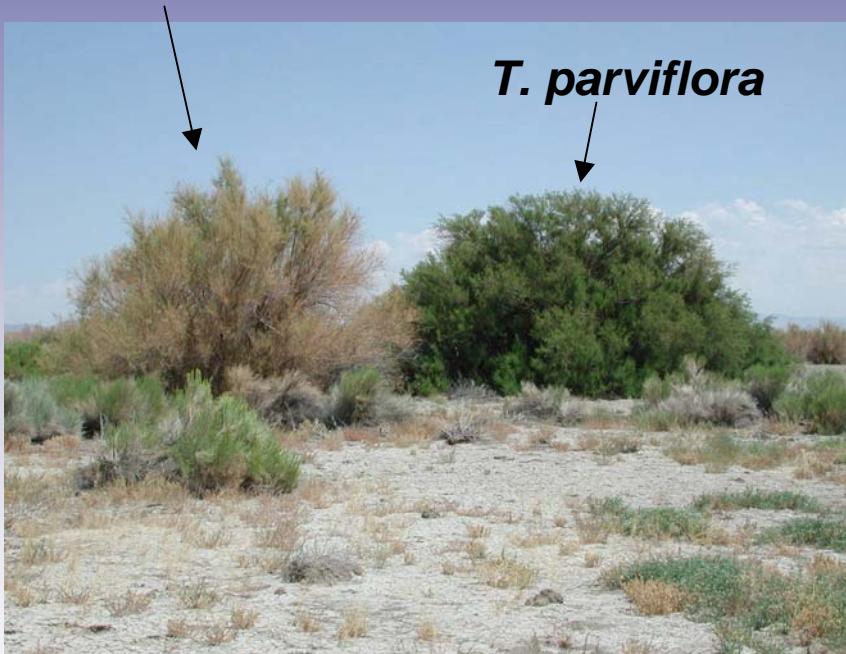

Crete, Greece (35.1° N)

- ◇— larvae
- pupae
- adults

# *Tamarix parviflora* – a poor host for *D. elongata*?

***T. ramosissima*** defoliated by *D. elongata*

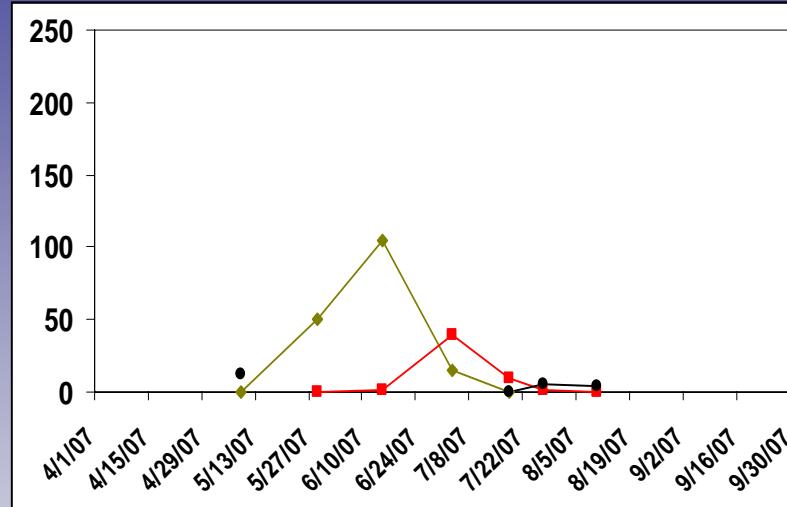

# San Antonio Creek 35.9° N

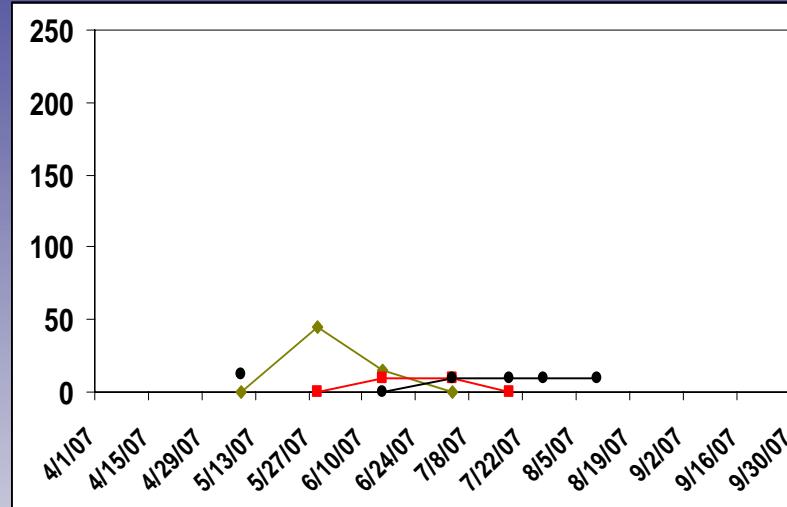

Host plant: *Tamarix parviflora*

Fukang, China (44.1° N)

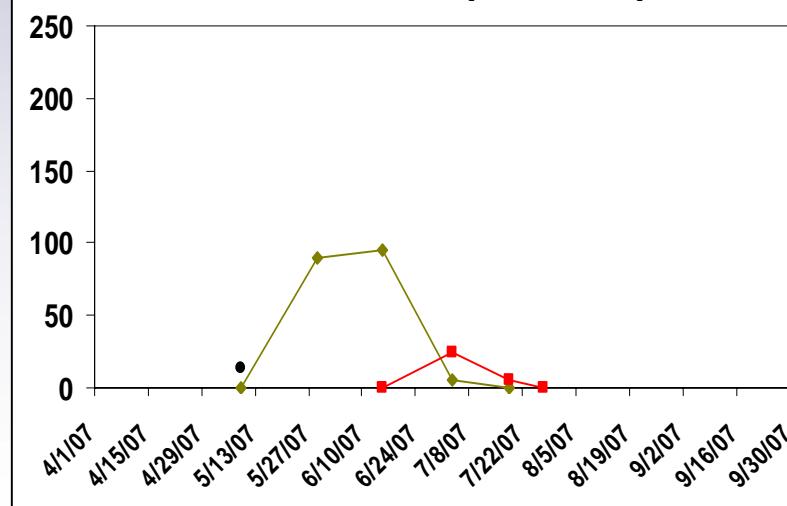

Turpan, China (43.5° N)

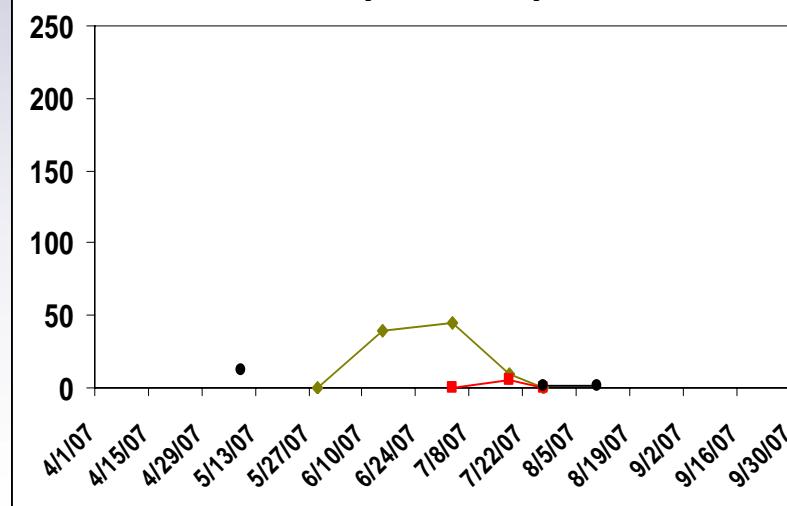

- larvae
- pupae
- adults

Karshi, Uzbekistan (38.1° N)

Crete, Greece (35.1° N)

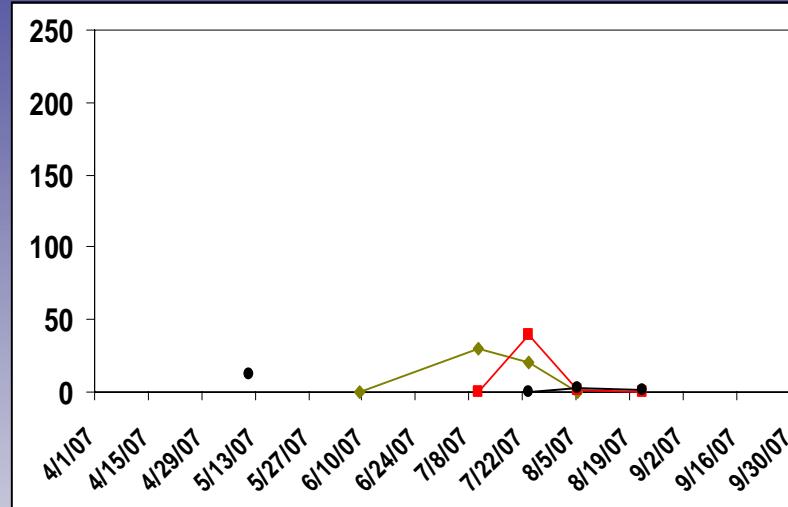

# Cache Creek 38.3° N

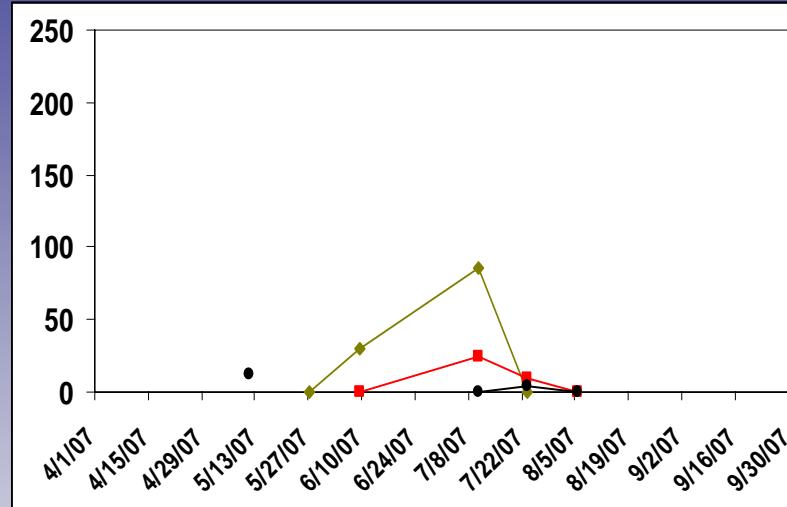

Host plant: *Tamarix parviflora*

Fukang, China (44.1° N)

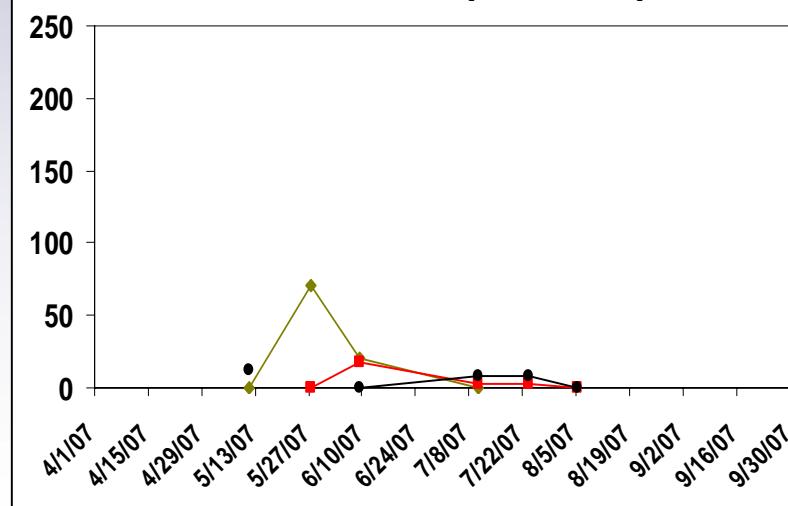

Turpan, China (43.5° N)

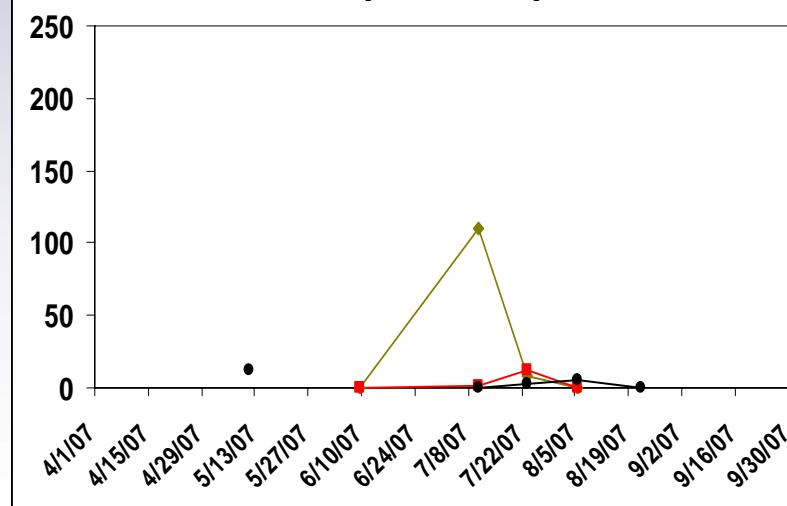

- ▲— larvae
- pupae
- adults

Karshi, Uzbekistan (38.1° N)

Crete, Greece (35.1° N)

# Conclusions

## *T. ramosissima*

- Uzbek and Crete works best in so. California (3-4 gen. - defoliation events)
- Turpan: mid-latitudes ( $36\text{-}38^{\circ}\text{N}$ )
- Fukang: above  $38^{\circ}\text{N}$

## *T. parviflora*

- Uzbek grows better than the other ecotypes on *T. parviflora*
- Crete population at Cache Creek, northern CA
