WEED DATA WANTED FOR THE CALFLORA DATABASE!

Three Ways to Contribute Data!

- 1) Enter individual non-native plant observations [online](#).
- 2) Submit an entire [GIS](#) dataset from a project.
- 3) Submit field observations of non-native plants via a [smartphone](#) application.

*A Frequently Asked Questions page about Contributing Plant Observations is posted at www.calflora.org/add/pofaq.html.

1) Enter individual non-native plant occurrences.

Go to www.calflora.org.
Certain data fields are required. If the corresponding field is missing, a small scrollable window with field name definitions.

Typing within the *Scientific* or *Common Name* fields automatically adds California's non-native plant names. Taxa not yet recorded in Calflora appear in the drop down menu. Once a taxon is selected you can expand to the lower left of the map.

If you know the coordinates, check the box to enter them; otherwise, the location. The drop-down menu in the map's upper right corner allows you to select a location.

You may also click on the *Photos* toggle to add your pictures associated with the observation.

After data entry is complete, click the Save button on the bottom left.

Under the Save button is an option to **publish the record** which makes the record available to all. Records can only be viewed by the person who entered them. Some contributors choose to work on certain records in an unpublished state, and then publish those records only when they are ready.

Contact sprrt@calflora.org for additional Calflora technical assistance.

Invasive Weeds Beware -- BAEDN Is Here!

"EARLY DETECTION" PROGRAM LAUNCHED TO MARK CALIFORNIA INVASIVE WEEDS AWARENESS WEEK
SF BAY AREA, CA JULY 20, 2009

Bay Area Early Detection Network gets rolling

Daniel Gluesenkamp, Audubon Canyon Ranch

Whether we are protecting humans from swine flu or protecting rivers from *Arundo donax*, early detection and rapid response (EDRR) is the most cost-effective approach for coping with biological invasions. Indeed, the official California Invasive Weed Action Plan identifies EDRR as "the single most important element" for coping with invasions. EDRR is a "stitch-in-time" approach which proactively deals with infestations before they can grow into large and costly environmental threats. By acting early we efficiently prevent the environmental and economic damage caused by harmful invaders, we can use less intrusive control techniques, and we dramatically reduce the

planning and resources required to manage populations compared to when they have grown larger and become well established. The Bay Area Early Detection Network (BAEDN) is an exciting new initiative

that builds an EDRR system to serve the entire nine-county San Francisco Bay Area: Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, Solano, and Sonoma counties. The group unites and coordinates the EDRR efforts of dozens of agencies, hundreds of professional land managers, and potentially thousands of volunteers. BAEDN partners work together to develop a scientifically rigorous list of the most harmful invasive plants, train each other in detection techniques, make detections and report them to the online website, and then prioritize individual patches so that the most dangerous outbreaks can be removed before they spread. It's simple, it's

...continued next page

have been harmed. It's simple, it's sensible,

Initiated in 2006 by Audubon Canyon Ranch Gluesenkamp, National Park Service's San Francisco Bay Area Office, U.S. Fish & Wildlife Service, and numerous colleagues throughout the Bay Area, the network, Calflora has built BAEDN's user-friendly Google map interface and pick-lists to make

In addition, BAEDN has hired Jennifer Stern, California Department of Food and Agriculture's Wildlife funding, ACR's Partners in Conservation Foundation have also supported BAEDN. Bay Area Watchers program, which trains volunteers at Gate National Recreation Area, and builds a

BAEDN -- A New Strategy for Invasives

By Don Mayall, Chair, Rare Plants, Santa Clara County

In 1984, a member of our Chapter discovered an unknown tarweed-like plant along the railroad tracks near Alviso in Santa Clara County. It was not even in the Jepson Manual. It was identified as stinkwort, (*Dittrichia graveolens*), an invasive nonnative from Europe. Little attention was paid to it by land managers, although it had been a pest plant in Australia for the past 150 years. It subsequently spread rapidly in the county forming a dense monoculture in wetlands, vacant fields, and along trails. It is now a serious problem to the Santa Clara Valley Water District and the County Parks and Recreation Department.

In 2004 a grass was noted growing under the redwoods at Thornewood Open Space Preserve in San Mateo County. A perennial bunchgrass, it seemed a lot like native grasses, but was checked out and discovered to be slender false brome (*Brachypodium sylvaticum*), a nonnative from Europe that had already spread through 10,000 acres in Oregon. Because of quick work by the Open Space District and the County Department of Agriculture, this infestation is being brought under control before it spreads widely.

The moral of these stories is that if an invasive plant is detected, its potential to become invasive is recognized, and responsible authorities are notified early enough, widespread environmental damage and costly control programs can be avoided. The California Invasive Weed Action Plan identifies early detection and rapid response as the single most important element for coping with pest plant invasion.

A new effort, the Bay Area Early Detection Network (BAEDN), has just been launched in the nine-county area around San Francisco Bay. This project has received funding from several sources, including the National Fish and Wildlife Foundation, the US Fish and Wildlife Service and the California Department of Food and Agriculture. BAEDN provides a system for easily reporting sightings of invasive plants and getting them into the Calflora Database,

News and Events Around the West

project

The local community chapters are committing labor force and other in-kind service with the Agency purchasing the needed chain saws, herbicide and licensed applicators.

Long range plans by Ft. Defiance Agency are to re-establish the historic vegetation along the Little Pueblo Colorado Wash that includes transplanting native species as Cottonwood and Navajo Willow along the stream bed. Long-term benefits are the protection and preservation of native vegetation which will enhance the beauty and conservation of the wash by controlling the aggressive woody species.

SF Bay Area Early Detection Network Each of us has been witness to an ugly invasion, each of us carry the memory of a wild piece of California which has been lost to weedy invaders. We all have noticed a small outbreak of some harmful weed, and thought "someone should do something about that before it expands."

Fortunately, there are tools which can save some of our remaining wild places. Whether we are protecting humans from swine flu or protecting rivers from *Arundo donax*, early detection and rapid response (EDRR) is the most cost-effective approach for coping with biological invasions. EDRR is a "stitch-in-time" approach which proactively deals with infestations before they can grow into large and costly environmental threats. By acting early we efficiently prevent the environmental and economic damage caused by harmful invaders, and we can use less intrusive techniques, and we dramatically reduce the planning and resources required to control large, established invasive plant populations.

We have all recognized the importance of early detection and rapid response (EDRR), and EDRR is consistently identified as "the single most important element" in coping with biological invasions (2005 California State Noxious Weed Action Plan). Of course, we also know about the benefits of regular exercise; it can be difficult to do what we know is right. An effective EDRR program is a rare thing; it requires large-scale coordination of multiple actors, it requires systems for prioritizing targets and managing multi-year treatment, it means that some large and compelling invasions go without treatment so that we can address small but important outbreaks.

The Bay Area Early Detection Network (BAEDN) is an exciting new initiative that builds an EDRR system to serve the entire nine-county San Francisco Bay Area. The group unites and coordinates the EDRR efforts of dozens of agencies, hundreds of professional

- ▲ Unknown
- ▲ Unverified

BAEDN Population Verifications as of October 3, 2011

Category	Definition	Number of sites	% of total sites
Extirpated	5 Consecutive years of surveillance shows no aboveground plants, or at least no aboveground plants found within the past 5+ years.	10	3.7%
Extirpated?	All plants removed over 5 years ago. Monitoring status for the site is uncertain though.	8	2.9%
Under surveillance	The site is checked for plants annually but there are no aboveground plants. The site is in transition from 'Under treatment' to 'Extirpation.' If any plants are found during surveillance the site status should return to 'Under treatment.'	21	7.7%
Under treatment	Target non-native species actively being removed.	135	49.6%
Partial treatment	Only part of the infestation being treated.	3	1.1%
Planned for treatment	Planned for treatment in 2011 or pending permits or funds.	16	5.9%
Not under treatment	Not under treatment by landowner or manager.	50	18.4%
Unknown	Not known by landowner or manager	26	9.6%
Unverified	No response from landowner, manager, or reporter when contacted about the site.	3	1.1%
	Total	272	100%

Reporting

How to Report an Occurrence and/or Share a Dataset

Data can be entered either as individual occurrences, or by uploading entire datasets.

- To upload a limited number of occurrences, proceed to the main [Occurrence Reporting](#) page and enter information in the provided fields. Click on any of the field names for help.
- To upload an entire dataset, please proceed to the [Upload Tool](#). Additional guidance about uploading entire datasets is available [here](#), or please contact BAEDN staff and we can provide assistance. All datasets are appreciated; we will happily upload datasets that include populations of widespread species, as well as early detections.
- [Mobile Reporting Tools](#) developed by BAEDN and Calflora to facilitate reporting occurrences using smart phones are now available in BETA.

The BAEDN Database and Calflora

BAEDN's Occurrence Reporting Database has been built by [Calflora](#), an organization dedicated to providing information about California plant biodiversity. Calflora's digital library is an important repository for information on California wild plants from diverse sources, with access to over 1 million plant records. Data can be easily searched on the internet, and query results can be readily downloaded.

Definition of an Occurrence

An occurrence, for the purposes of the BAEDN database, is any occurrence of a non-native plant species. All infestation reports are important; and reports of even widespread species are important for identifying which

What is Early Detection?

[Report](#)

What counts as an early detection?

- Species which are not yet widespread. The most important species for rapid response are listed on the Priority Species List, which will soon be available for download.
- Species which are widespread, but in areas where they are not yet abundant.
