

Invasive Plant Checklist for California Landscaping

2018.05.08

California's Model Water-Efficient Landscaping Ordinance and the CALGreen Building Standards strongly discourage the use of invasive plants in landscaping. This checklist is designed to serve as a reference to help landscape designers in California avoid the use of invasive plants. Three sources are referenced: the California Dept. of Food & Agriculture (CDFA), which regulates plants in the state; the PlantRight initiative, which brings together a diverse range of stakeholders, including the nursery and landscaping industry, to prevent the use of invasive plants in horticulture; and the California Invasive Plant Council (Cal-IPC), which assesses the environmental impact of invasive plants.

The California Dept. of Food & Agriculture has authority to designate noxious weeds in California. These plants are illegal. See www.cdfa.ca.gov/plant/IPC. In general, CDFA is restricted from listing horticultural plants as noxious weeds.

PlantRight is a collaborative, science-based, and voluntary program led by the nonprofit Sustainable Conservation, with a steering committee representing the green industry, agencies, universities and environmental groups. PlantRight's list is entirely voluntary. It includes plants from the Cal-IPC Inventory that all stakeholders agree should not be used in landscaping in regions where they cause environmental damage. See www.plantright.org.

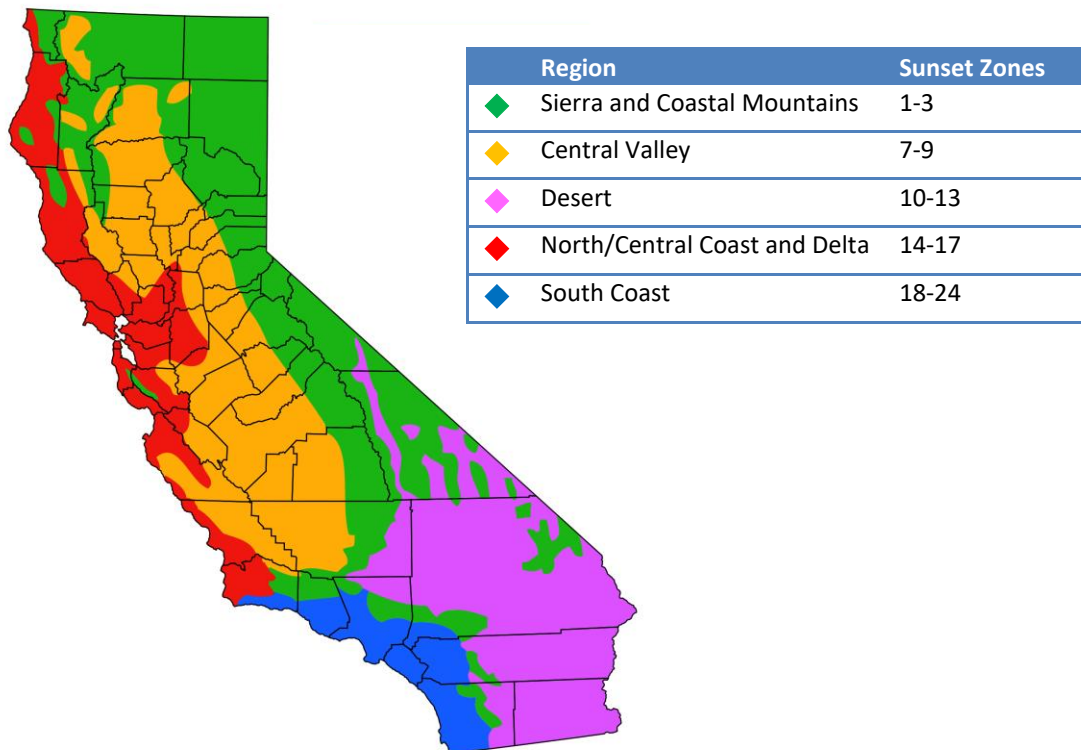

The California Invasive Plant Council is a nonprofit organization that maintains a list of environmentally harmful plants based on a transparent science-based criteria system. Cal-IPC supports land managers working to stop the spread of invasive plants, but also supports landscape professionals in preventing horticultural introductions of invasive plants. Cal-IPC listing is for informational purposes and carries no any regulatory authority. See www.cal-ipc.org.

The following checklist includes all plants from each list that are known from horticulture. Plants from the CDFA Noxious Weed List are illegal and marked with a red **X**. Plants for which PlantRight has reached

consensus with all partners including the nursery industry are marked with a green X. All other species are only listed by Cal-IPC.

Regions based on Sunset Climate Zones were developed by PlantRight ([see source online](#)).

Notes		
E	Edible	This plant species has edible fruit and is grown for human consumption. Though birds may spread seeds, these plants can be grown relatively safely if fruit is harvested. Particular care should be taken near riparian areas. Fruitless varieties may be available for landscaping, and can be grown safely.
F	Forage	This plant species is used for forage and is already widespread in California. Additional use is unlikely to increase the plant's spread.
T	Turfgrass	This plant species is used for turfgrass and may be used safely for sports fields and landscaping if properly tended within borders.
