

## 2010 Bay Area Early Detection Network Prioritized Species & Populations

- BAEDN has prioritized both species for early detection throughout the region, as well as their corresponding populations for rapid response.
  - 73 species known to be invasive and have limited Bay Area distributions have been prioritized through an analysis of over 1400 species.
    - 272 Bay Area populations of these species have been identified from Calflora occurrence records of observations from January 1, 2000 through July 12, 2010, corresponding to 833 records. These records were each buffered by 100 meters. Conspecific points within 100 meters of each other were merged, resulting in 272 “populations.” This was done in an effort to account for redundant reporting.
    - These populations correspond to 49 of the priority species. Factoring out the extirpated populations leaves 47 species in consideration.
- Each population was prioritized for eradication using WHIPPET, an analytical model that prioritizes eradication targets based on relative impact, invasiveness, and feasibility of eradication, weighing species level, and population specific factors in the ranking.
  - Additional information will be used to fill data gaps and best interpret model results. These data include population size, accessibility, driving time, etc.

## Population Status Verification

- BAEDN coordinators have associated each population with a “responsible party,” a land owner/manager, agricultural commissioner, etc. Through these contacts, BAEDN coordinators have investigated the status of each priority population to learn which are being treated and to what effect, and also to urge treatment if necessary. The verification process has yielded a shorter list of untreated target populations that BAEDN will work towards treating.

## BAEDN Population Verifications as of April 15, 2011

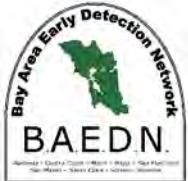

<b>Category</b>	<b>Definition</b>	<b>Number of sites</b>	<b>% of total sites</b>
<b>Extirpated</b>	5 Consecutive years of surveillance shows no aboveground plants, or at least no aboveground plants found within the past 5+ years.	10	3.7%
<b>Extirpated?</b>	All plants removed over 5 years ago. Monitoring status for the site is uncertain though.	8	3.0%
<b>Under surveillance</b>	The site is checked for plants annually but there are no aboveground plants. The site is in transition from 'Under treatment' to 'Extirpation.' If any plants are found during surveillance the site status should return to 'Under treatment.'	20	7.4%
<b>Under treatment</b>	Target non-native species actively being removed.	126	46.5%
<b>Partial treatment</b>	Only part of the infestation being treated.	3	1.1%
<b>Planned for treatment</b>	Planned for treatment in 2011 or pending permits or funds.	18	6.6%
<b>Not under treatment</b>	Not under treatment by landowner or manager.	48	17.6%
<b>Unknown</b>	Not known by landowner or manager	27	9.6%
<b>Unverified</b>	No response from landowner, manager, or reporter when contacted about the site.	12	4.4%
	<b>Total</b>	<b>272</b>	<b>100.0%</b>
